

Programs as Data 8
A stack machine for micro-C;
compiling micro-C
to stack machine code

Peter Sestoft
Monday 2013-10-07

Today

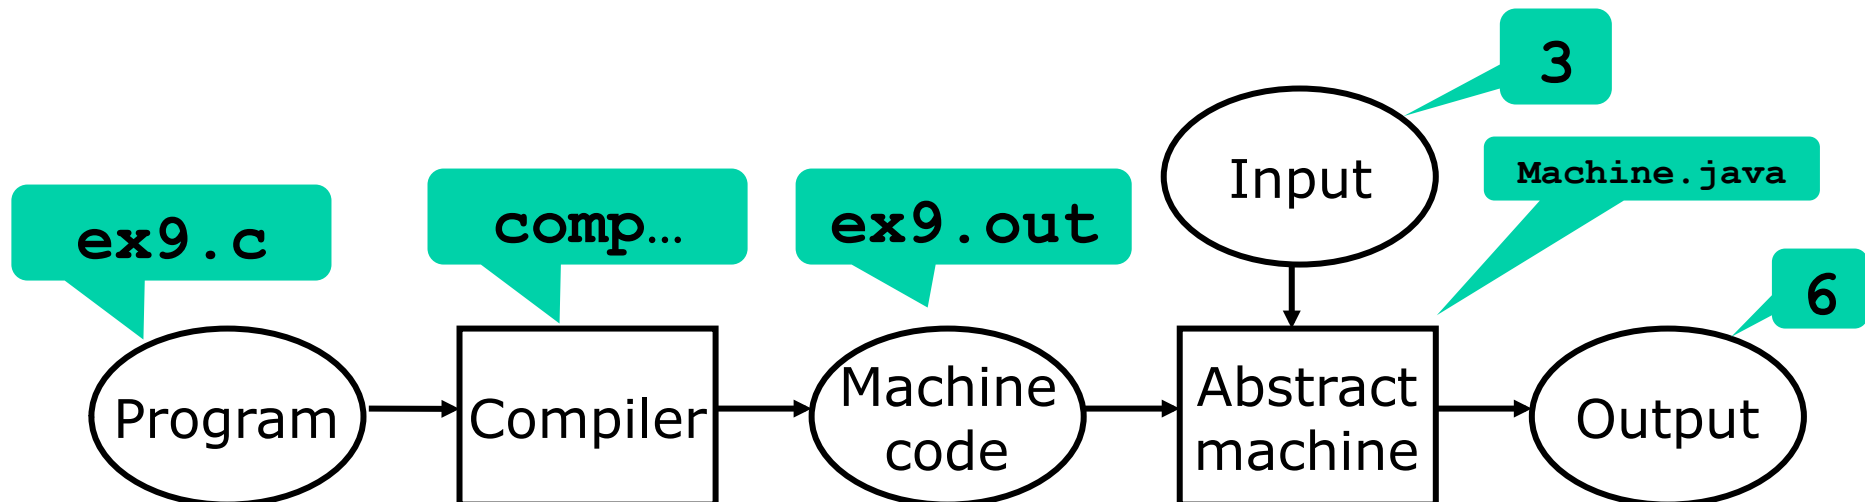

- Stack machine, target for micro-C compiler
 - Stack machine state
 - Instruction set
 - Implementations in Java and C
- Compiling micro-C to stack machine code

Interpretation and compilation

- Interpretation = one-stage execution/evaluation:

- Compilation = two-stage execution/evaluation:

Stack machine state transitions

Instruction	Stack before	Stack after	Effect
0 CISTI i	s	$\Rightarrow s, i$	Push constant i
1 ADD	s, i_1, i_2	$\Rightarrow s, (i_1 + i_2)$	Add
2 SUB	s, i_1, i_2	$\Rightarrow s, (i_1 - i_2)$	Subtract
3 MUL	s, i_1, i_2	$\Rightarrow s, (i_1 * i_2)$	Multiply
4 DIV	s, i_1, i_2	$\Rightarrow s, (i_1 / i_2)$	Divide
5 MOD	s, i_1, i_2	$\Rightarrow s, (i_1 \% i_2)$	Modulo
6 EQ	s, i_1, i_2	$\Rightarrow s, (i_1 = i_2)$	Equality (0 or 1)
7 LT	s, i_1, i_2	$\Rightarrow s, (i_1 < i_2)$	Less-than (0 or 1)
8 NOT	s, v	$\Rightarrow s, !v$	Negation (0 or 1)
9 DUP	s, v	$\Rightarrow s, v, v$	Duplicate
10 SWAP	s, v_1, v_2	$\Rightarrow s, v_2, v_1$	Swap
11 LDI	s, i	$\Rightarrow s, s[i]$	Load indirect
12 STI	s, i, v	$\Rightarrow s, v$	Store indirect $s[i] = v$
13 GETBP	s	$\Rightarrow s, bp$	Load base ptr bp
14 GETSP	s	$\Rightarrow s, sp$	Load stack ptr sp
15 INCSP m	s	$\Rightarrow s, v_1, \dots, v_m$	Grow stack ($m \geq 0$)
15 INCSP m	s, v_1, \dots, v_{-m}	$\Rightarrow s$	Shrink stack ($m < 0$)
16 GOTO a	s	$\Rightarrow s$	Jump to a
17 IFZERO a	s, v	$\Rightarrow s$	Jump to a if $v = 0$
18 IFNZRO a	s, v	$\Rightarrow s$	Jump to a if $v \neq 0$
19 CALL $m a$	s, v_1, \dots, v_m	$\Rightarrow s, r, bp, v_1, \dots, v_m$	Call function at a
20 TCALL $m n a$	$s, r, b, u_1, \dots, u_n, v_1, \dots, v_m$	$\Rightarrow s, r, b, v_1, \dots, v_m$	Tailcall function at a
21 RET m	$s, r, b, v_1, \dots, v_m, v$	$\Rightarrow s, v$	Return $bp = b, pc = r$
22 PRINTI	s, v	$\Rightarrow s, v$	Print integer v
23 PRINTC	s, v	$\Rightarrow s, v$	Print character v
24 LDARGS	s	$\Rightarrow s, i_1, \dots, i_n$	Command line args
25 STOP	s	$\Rightarrow _$	Halt the machine

Example stack machine program

- A simple program, file prog1:

```
0 20000000 16 7 0 1 2 9 18 4 25
```

Numeric
code

```
0 20000000
16 7
0 1
2
9
18 4
25
```

```
0: CSTI 20000000
2: GOTO 7
4: CSTI 1
6: SUB
7: DUP
8: IFNZRO 4
10: STOP
```

Symbolic
code

- Running the code in file prog1:

```
C:>java Machine prog1
Ran 0.641 seconds
```

Machine state: p, pc, s, sp, bp

Stack machine for micro-C

- Runtime state:
 - Program **p**, holds the instructions
 - Program counter **pc**, points to next instruction
 - Stack **s**, holds variables and intermediate results
 - Stack pointer **sp**, points to top of stack
 - Base pointer **bp**, points to first local variable in top stack frame
- Structure of the stack
 - Bottom: Global variables
 - One stack frame for each active method

Implementations of the micro-C abstract machine

- File Machine.java: An implementation of the abstract machine as a Java program
- File machine.c: An implementation of the abstract machine as a C program

- File Machine.fs: A definition of the instruction set for use in the compiler Comp.fs
- The instruction numbers in Machine.fs agree with Machine.java and machine.c

Stack machine instruction execution

Java or C
or C#

```
for (;;) {
    switch (p[pc++]) {
    case CSTI:
        s[sp+1] = p[pc++]; sp++; break;
    case ADD:
        s[sp-1] = s[sp-1] + s[sp]; sp--; break;
    case EQ:
        s[sp-1] = (s[sp-1] == s[sp] ? 1 : 0); sp--; break;
    case DUP:
        s[sp+1] = s[sp]; sp++; break;
    case LDI:
        s[sp] = s[s[sp]]; break;
    case GOTO:
        pc = p[pc]; break;
    case IFZERO:
        pc = (s[sp--] == 0 ? p[pc] : pc+1); break;
    case ...
    case STOP:
        return sp;
    ...
} }
```

Structure of the micro-C stack

- Computing factorial with MicroC/ex9.c

```
void main(int i) {
    int r;
    fac(i, &r);
    print r;
}

void fac(int n, int *res) {
    if (n == 0)
        *res = 1;
    else {
        int tmp;
        fac(n-1, &tmp);
        *res = tmp * n;
    }
}
```

- **n** is input parameter
- **res** is output parameter, a pointer to where to put the result
- **tmp** holds the result of the recursive call
- **&tmp** gets the pointer to **tmp**

Runtime storage: the stack

- The store is an indexable stack
 - bottom: global variables at fixed addresses
 - followed by activation records

- An *activation record* is an executing function
 - return address
 - old base pointer
 - local variables
 - temporaries

Compiling micro-C

- Overall structure of a micro-C program
 - Global variable declarations `int x; int y;`
 - Global function declarations `void main(...) {...}`
- Overall structure of the generated code:
 - Code to allocate all global variables
 - Code to load arguments, call `main`, and stop
 - Code for each function, including `main`
- Structure of code for a function:
 - Code for the function's body statement
 - Code (RET) to return from the function

Observations

- At runtime, a local variable's place within a stack frame is always the same
- This *offset* can be computed at compile-time
- The compiletime environment in the micro-C compiler maps a local variable to an offset
- The runtime environment is the stack of activation records in the abstract machine
- At runtime, the base pointer BP points at the bottom of the current activation record
- So a local variable's address is $BP + \text{offset}$

Variable offsets

- Example MicroC/ex9.c again:

```
void main(int i) {  
    int r; 1  
    fac(i, &r);  
    print r;  
}  
  
void fac(int n, int *res) {  
    if (n == 0)  
        *res = 1;  
    else { 2  
        int tmp;  
        fac(n-1, &tmp);  
        *res = tmp * n;  
    }  
}
```

Compile-time environments

- varEnv = variable environment
 - maps global variable to global address in stack
 - maps local variable to offset in activation record
- funEnv = function environment
 - maps function name to
(label, returntype, parametertypes)

Main micro-C compiler functions

- **cStmt stmt varEnv funEnv : instr list**
 - Compile **stmt** to code that performs the statement's actions
- **cExpr expr varEnv funEnv : instr list**
 - Compile **expr** to code that leaves the expr's rvalue on the stack top
- **cAccess expr varEnv funEnv : instr list**
 - Compile **expr** to code that leaves the expr's lvalue on the stack top
- **cProgram topdecs : instr list**
 - Build global varEnv and global funEnv
 - Generate code for global variables
 - Generate code to call function **main**
 - Generate code for all functions, including **main**

Micro-C abstract syntax

type typ =			
TypI	(* Type int		*)
TypC	(* Type char		*)
TypA of typ * int option	(* Array type		*)
TypP of typ	(* Pointer type		*)
and expr =			
Access of access	(* x or *p or a[e]		*)
Assign of access * expr	(* x=e or *p=e or a[e]=e		*)
Addr of access	(* &x or &*p or &a[e]		*)
CstI of int	(* Constant		*)

Types

rvalue

Expressions

lvalue

Statements

Declarations

Compiling arithmetic expressions and assignment

- `<e1>` means: the result of compiling `e1`

Compile 17 as rvalue:

`CSTI 17`

Compile `e1 + e2` as rvalue:

`<e1> as rvalue`

`<e2> as rvalue`

`ADD`

Compile `e1 = e2` as rvalue:

`<e1> as lvalue`

`<e2> as rvalue`

`STI`

`cExpr`

Micro-C compiler fragment

```
and cExpr e varEnv funEnv : instr list =
  match e with
  | Access acc          -> cAccess acc varEnv funEnv
                          @ [LDI]
  | Assign(acc, e)     -> cAccess acc varEnv funEnv
                          @ cExpr e varEnv funEnv
                          @ [STI]
  | CstI i              -> [CSTI i]
  | Addr acc            -> cAccess acc varEnv funEnv
  | Prim2(ope, e1, e2) ->
    cExpr e1 varEnv funEnv
    @ cExpr e2 varEnv funEnv
    @ (match ope with
       | "*"          -> [MUL]
       | "+"          -> [ADD]
       | "<"          -> [LT]
       | ...)
  | ...
```

Compiling comparisons

Compile $e1 < e2$ as rvalue:

`<e1>` as rvalue

`<e2>` as rvalue

LT

cExpr

- Q: How compile \geq , $>$, \leq when we have only LT?
- A: Use NOT and SWAP – but how?

Compiling lvalues and rvalues

Compile x as lvalue:

GETBP

CSTI $\langle xoffset \rangle$

ADD

Compile e as rvalue:

$\langle e \rangle$ as lvalue

LDI

Compile $e_1[e_2]$ as lvalue:

$\langle e_1 \rangle$ as rvalue

$\langle e_2 \rangle$ as rvalue

ADD

Compile $\&e$ as rvalue:

$\langle e \rangle$ as lvalue

Compile $*e$ as lvalue:

$\langle e \rangle$ as rvalue

cAccess

cExpr

Compiling blocks and declarations

- To compile a block { **s1 s2 ... sn** }
 - Make new scope in varEnv
 - Compile **<s1> <s2> ... <sn>**
 - Drop new scope from varEnv
 - Generate code (INCSP (-m)) to forget m locals
- To compile int declaration **int x**
 - Generate code to increment stack pointer by 1
- To compile array declaration **int a[5]**
 - Generate code to allocate 5 stack places, that is, increment stack pointer by 5
 - Generate code to compute address of the first of those locations, and put it on the stack

Statement compilation schemes

Compile if (e) s1 else s2:

```
    <e> as rvalue
    IFZERO L1
    <s1>
    GOTO L2
L1: <s2>
L2:
```

Compile while (e) s:

```
    GOTO L2
L1: <s>
L2: <e> as rvalue
    IFNZRO L1
```

Compile e; :

```
<e> as rvalue
INCSP -1
```

cStmt

Micro-C compiler fragment

```
let rec cStmt stmt varEnv funEnv : instr list =
  match stmt with
  | If(e, stmt1, stmt2) ->
    let labelse = newLabel()
    let labend  = newLabel()
    in cExpr e varEnv funEnv @ [IFZERO labelse]
      @ cStmt stmt1 varEnv funEnv @ [GOTO labend]
      @ [Label labelse] @ cStmt stmt2 varEnv funEnv
      @ [Label labend]
  | While(e, body) ->
    let labbegin = newLabel()
    let labtest  = newLabel()
    in [GOTO labtest; Label labbegin]
      @ cStmt body varEnv funEnv
      @ [Label labtest] @ cExpr e varEnv funEnv
      @ [IFNZRO labbegin]
  | Expr e -> cExpr e varEnv funEnv @ [INCSP -1]
  | ...
```

Ten-minute exercise

- What code should be generated for a **do-while** block:

```
do
    stmt
while (e) ;
```

- What code should be generated for a **for** statement:

```
for (e1; e2; e3)
    stmt
```

Compiling and running Micro-C programs

```
fslex --unicode CLex.fsl  
fsyacc --module CPar CPar.fsy  
fsi -r FSharp.PowerPack.dll Absyn.fs CPar.fs \  
    CLex.fs Parse.fs Machine.fs Comp.fs ParseAndComp.fs
```

Build compiler

```
open ParseAndComp;;  
compileToFile (fromFile "ex9.c") "ex9.out";;  
#q;;
```

Compile fac ex.

```
javac Machine.java
```

Compile stack
machine

```
java Machine ex9.out 8
```

Run it

```
java Machinetrace ex9.out 8
```

... with tracing

The code generated for ex9.c

```
0 LDARGS      init

The code generated for ex9.c

The image displays assembly code for a program named ex9.c, organized into three columns. Colored arrows indicate control flow: red arrows show jumps from CALL instructions to their respective labels; cyan arrows show jumps from RET instructions to the start of the next function; black arrows show jumps from GOTO instructions to their respective labels. The code includes labels L1, L2, L3, and L4, and various instructions such as LDARGS, CALL, STOP, LDI, GETBP, CSTI, ADD, EQ, IFZERO, STI, INCSP, GOTO, PRINTI, and RET.

```

Shortcomings of the compiler

- The compiler often generates inefficient code

GETBP					
CSTI 0	could	GETBP	INCSP -1	could	INCSP -2
ADD	be	LDI	INCSP -1	be	
LDI					

- The compiler itself is inefficient, using (@) a lot:

```
| If(e, stmt1, stmt2) ->
  let labelse = newLabel()
  let labend  = newLabel()
  in cExpr e varEnv funEnv @ [IFZERO labelse]
    @ cStmt stmt1 varEnv funEnv @ [GOTO labend]
    @ [Label labelse] @ cStmt stmt2 varEnv funEnv
    @ [Label labend]
```

- Tail calls are not executed in constant space
- We fix these problems in course week 10

Adding a switch-statement to micro-C

- Exercise this week, add switch-statement:
 - each case has an int constant and a block
 - implicit **break**, no fall-through; no explicit **break** or **default**

```
switch (month) {
  case 2:
    { days = 28; if (y%4==0) days = 29; }
  case 3:
    { days = 31; }
  case 1:
    { days = 31; }
}
```

- May be compiled as a sequence of tests
- The abstract syntax may be as simple as this:

```
Switch of expr * (int * stmt) list
```

Reading and homework

- This week's lecture:
 - PLCSD chapter 8
 - Exercises 8.1, 8.3, 8.4, 8.5, 8.6
- Next week's lecture
 - The Java and C#/.NET virtual machines
 - Garbage collection techniques
 - PLCSD chapter 9 and 10
 - David Bacon: Realtime garbage collection
