

introduction to **SCRIPTING, DATABASES, SYSTEM ARCHITECTURE**

WEB SERVICES III (advanced + quiz + A11)

Claus Brabrand

`(( ( brabrand@itu.dk ) ))`

Associate Professor, Ph.D.

`(( ( Software and Systems ) ))`

 **IT University of Copenhagen**

Exam Eligibility

- Originally:

"10 out of 11"

- Then, two things happened:

"A8 optional" (technical problems)

"A11 optional" (exam office deadline)

- Which then means:

"10 out of 11" (A8 + A11 auto approved)

= **"8 out of the 9"** (A1 – A7, A9, and A10)

- Now (strictly better for you):

"8" (any approved assignments)

Agenda

- **Advanced topics:**
 - Cookies
 - Sessions
 - User Authentication
 - Encrypted Communication
- **Web Service: Quiz**
- **A11: Last Year's Exam** (exam training)

User Authentication (log in)

- Recall To-Do-List:

Danger: insecure !
(a hacker can "bypass" login by "jumping" directly to todoist.php)

Solution: simply re-check password every single time!

... but then we'd also have to ! ...:

embed password
(as 'hidden' input or extra "?" argument)
every single time!

Session State

- Actually an instance of a more general issue:
 - We would like certain data to persist across **several client-server interactions** (known as a **session**):

Session State

- Recall To-Do-List:

Three Types of State

■ Temporary State:

- Data local to one script
- (i.e., PHP variables)

```
<?php
  $x = 42 ;
  echo $x ;
?>
```

■ Persistent State:

- Permanent data
- (i.e., data we put in the database)

■ Session State:

- Data across many client-server interactions in a Web Service
(use tons and tons of "hidden" fields or ...)

"Cookies":

Cookies in One Slide

■ Example:

```
<html>
<body>
  <?php setcookie("x", "42"); ?>
  Click
  <a href="getcookie.php">here</a>
  to see the cookie.
</body>
</html>
```

name

value

setcookie.php

Click [here](#) to see cookie

```
<html>
<body>
  Cookie <b>x</b> has the value:
  <?php
    $v = $_COOKIE['x'];
    echo "<b>$v</b>";
  ?>
</body>
</html>
```

reading value of
cookie named 'x'

Cookie x has value: 42

getcookie.php

Limitations of Cookies

- Size limits (4000 chars in most browsers)
- Browsers only store a limited # of cookies
- They can be intercepted (eavesdropped)
- ...

User Authentication (log in)

- Recall To-Do-List:

Danger: insecure !
(a hacker can "bypass" login by "jumping" directly to **todoist.php**)

Solution: simply re-check password every single time!

... but then we'd also have to ! ...:

embed password
(as 'hidden' input or extra "?" argument)
every single time!

Authentication /w Cookies

- Recall To-Do-List:

Danger: insecure !
(a hacker can "bypass" login by "jumping" directly to `todoist.php`)

check cookie

Browser will auto'ly transmit Cookies every time for us!

Exercise on Cookies

■ script-1.html:

- Enter password and submit to 'script-2.php' (below)

■ script-2.php:

- Validate password (e.g.: "12345")
- Set cookie (e.g.,: password_checked = "ok")
- Make link to 'script-3.php' (below)

■ script-3.php:

- Read cookie
- Check cookie: `if (password_checked != "ok") { error(...); }`

Sessions (home made)

■ Now we can make *"home made" sessions*:

```
if ( !isset($_COOKIE['sid']) ) { // 'sid' for 'session identifier'
    $sid = random(100000000) ;    // big random number (hard to guess)!
    setcookie("sid", $sid) ;
} else {
    $sid = $_COOKIE['sid'] ;
}
```

session_data:

sid	data
318381917	some-data...
723124842	other-data...
433102938	more-data...

■ Write session data:

```
mysql_query("INSERT INTO session_data (sid, data)
            VALUES ('$sid', '$data')");
```

■ Read session data:

```
$rows = mysql_query("SELECT * FROM session_data WHERE sid = '$sid'");
$row = mysql_fetch_array($rows);
$data = $row['data'] ;
```

■ Good news: sessions are *"built in"* in PHP !

PHP Sessions

■ *Initialize session:*

- ```
session_start(); // uses Cookies much like in
 // our "home made" sessions!
```

## ■ *Write session data:*

- ```
$_SESSION['x'] = $data ;    // write session data
```

■ *Read session data:*

- ```
$data = $_SESSION['x'] ; // read session data
```

## ■ *Close session:*

- ```
$_SESSION = array() ;      // this saves memory!  
session_destroy();
```

Exercise on PHP Sessions

■ script-1.html:

- Enter password and submit to 'script-2.php' (below)

■ script-2.php:

- Start session
- Validate password (e.g.: "12345")
- Set session data (e.g.,: password_checked = true)
- Make link to 'script-3.php' (below)

■ script-3.php:

- Read session data
- Check session data: `if (!password_checked) { error(...); }`
- Destroy session

Encrypted Communication

- **HTTPS** (Secure HTTP) uses **SSL** encryption:

- Just replace '**http**' with '**https**' in all URLs :-)

Agenda

- **Advanced topics:**

- **Cookies**
- **Sessions**
- **User Authentication**
- **Encrypted Communication**

- **Web Service: Quiz**

- **A11: Last Year's Exam** (exam training)

Quiz Service

Carry out the four web service steps:

- **3) site map**
- **1) data model**
- **2) database transactions**
- **4) "just" program it all (in PHP+SQL)**

Quiz Service

■ 3) Site map:

Web Service: Quiz

```
CREATE TABLE questions (
  qid INT PRIMARY KEY AUTO_INCREMENT,
  question VARCHAR(100) NOT NULL,
  answer VARCHAR(50) NOT NULL,
  wrong1 VARCHAR(50) NOT NULL,
  wrong2 VARCHAR(50) NOT NULL
);
```

1) Data Model:

questions:

qid	question	answer	wrong1	wrong2
1	What is the average rainfall in Amazon basin?	2000 mm per year	200 mm per year	20000 mm per year
2	Who won the EURO 92?	Denmark	Germany	France

AUTO

2) Data Transactions:

Add question:

```
INSERT INTO questions (question, answer, wrong1, wrong2)
VALUES ('Who won EURO92?', 'Denmark', 'Germany', 'France');
```

Select questions:

```
SELECT * FROM questions ;
```

3) Sitemap:

start.html

```
<html>
  <body>
    <h3>Welcome to the Quizzzzzzz</h3>

    <a href="add_q.html">ADD question</a>
    <p/>
    <a href="quiz.php">TAKE quiz</a>

  </body>
</html>
```

add_q.html

```
<html>
  <body>
    <h3>Please Add a Question</h3>

    <form action="add_q.php">
      Question:<br/>
      <input type="text" size="80" name="question"/>?
      <p/>
      The Answer:</br>
      <input type="text" size="80" name="answer"/>
      <p/>
      A Wrong Answer:</br>
      <input type="text" size="80" name="wrong1"/>
      <p/>
      Another Wrong Answer:</br>
      <input type="text" size="80" name="wrong2"/>
      <p/>
      <input type="submit" value="Add Q!"/>

    </form>

  </body>
</html>
```

The screenshot shows a web browser window with the URL `itu.dk/people/brabrand/DSDS/quiz/add_q.html`. The page title is "Please Add a Question". The form contains the following fields and labels:

- Question:** A text input field containing "What is the average rainfall in the Amazon basin" followed by a question mark.
- The Answer:** A text input field containing "2000mm per year".
- A Wrong Answer:** A text input field containing "20000mm per year".
- Another Wrong Answer:** A text input field containing "200mm per year".
- Add Q!** A submit button.

add_q.php

```
<?php

include("fn_mydb_connect.php");
include("fn_input_validation.php");

mydb_connect();

$question = $_REQUEST['question'] ;
$answer = $_REQUEST['answer'] ;
$wrong1 = $_REQUEST['wrong1'] ;
$wrong2 = $_REQUEST['wrong2'] ;

chk_text($question);
chk_text($answer);
chk_text($wrong1);
chk_text($wrong2);

mysql_query("INSERT INTO questions (question, answer, wrong1, wrong2)
            VALUES ('$question', '$answer', '$wrong1', '$wrong2');");

header("Location: start.html");
mysql_close();

?>
```
